

ABSTRACT OF THE DISCLOSURE

A print job creation process includes a print service selection step, an image registration step, a
5 template selection step, a layout editing step, and a print step. A template selection window, which is open in the template selection step, has a checkbox 'Use Print Image Matching 2 / Exif Print' to set execution or non-execution of printing with shooting information. In
10 the case of setting execution of the printing with shooting information, part of image editing options are restricted in the layout editing step. This arrangement readily creates a print job, while effectively preventing high-quality printing with shooting information from
15 being damaged by editing the image.
